#4

Project Name	Twitch status info	Project Type	Mobile + Web
Project Category	Social		
Duration	1 month	Team Size	1
Description	Twitch Status info Is custom plugin to fetch the details of channels from twitch using twitch api. The plugin fetches information from twitch api of streamers like user profile(name, picture) his online status, what game he is streming etc. The fetched list is shown on front end of clients side in 2 categories, The user could be hidden from frontend even if he is online on twitch based on time settings provided in backend. Also the plugin was made w3 total cache friendly, so Fragment refresh concept of w3 total cache was implemented. My role was in the project was as follow. 1. Create new plugin using Twitch API. 2. Provide backend setting pages to add channel/streamer and settings for styling. 3. Category wise display of streamers. 4. Create setting section to add calender to disable streamer. 5. Disable streamers from frontend according to setting.

#13

Project Name	Dance FM	Project Type	Mobile + Web
Project Category	Social		
Duration	4 months	Team Size	2
Description	This is radio website in Dubai. There are different entity like programs, presenter, artists, competitions in this website. I have extended wordpress admin and added module like programs, presenter, artists, competitions. We have made relations in between these modules. We have also added custom fields under each module like image/video uploader and text fields. Apart from this there are other modules like competition participent entries, subscriber's list entries in admin has been done. There is gallery module in which one can upload images as well as videos under each album. Each gallery album can be associated with single program, presenter or artist. There is ads management module in admin with the help of that one can display particular ads on particular page of program, artist, presenter or any other page. All above moules are created by doing coding, no plugin has been used for this. For most of listing in backend we have given export to excel facility. On front-end there is program slider at header. Each day that specific day's program get loaded in this header slider. Also in a day, with respect to current time that specific program having that time get loaded on that vertical pink line in slider, this is something like current ongoing program on website. There are different listing page like programs listing, artist listing, event listing and competitions listing page. On home page there are small snippets of each module like programs, events, artists, competitions, gallery, events. There are video and photo gallery pages. There are poup for displaying photos corresponding to particular gallery.

#16

Project Name	Scanme Asia	Project Type	Desktop + Web
Project Category	Ecommerce		
Duration	3 months	Team Size	1
Description	In this project backend and frontend is maintained. We have used wordpress default backend but extended functionality of backend according to client's requirement. * Frontend : There are three types of user registration. 1.Dealer 2.Agent 3.Customer Dealer and Agent can create their accounts. They can view their profile. Dealer can add agent and customer. Agent can add customer. According to that commission is assigned to them. Customer can view, edit their profile. Customer can add different types of QR code. For that he has to subscribe for packages of Scanme Asia. Customer can edit and view qrcode. After adding QR code, qr link is generated. MOLpay payment gateway is used for payment. After payment invoice for every payment is created. Every customer registered through website is also registered as wordpress user. Every customer can have their own wordpress backend where he/she can add business page or can edit it. * Backend : All registered users like customer, agent and dealer are displayed in backend where admin can approve any user. Only after approval user can login. Also admin can add packages for subscription. Admin can add tax rate according to country for every package. Admin can add countries which are displayed throughout website. If any user paid by cheque then admin acn approve cheque details only after that subscription is completed. Admin can also add business page. Also there is sub-domain like classified and bqr. In classified user can register and add their posts. bqr is for qrlink where qr code details are displayed.
